

eLML OpenOffice Plugin

The plugin adds eLML functionality to your OpenOffice Writer. You can easily create eLML lessons by using a WYSIWYG interface (toolbar) and save everything as an eLML XML by using the XSL Filter.

This document should help you to get started with the plugin. Read the *Requirements* and *Installation* carefully. The User Guide gives you some input on how to use the plugin (this section is not finished yet!) and by checking the compliance table you can see which elements and attributes of eLML have been implemented yet.

2. [Requirements](#)
3. [Installation](#)
4. [Uninstall / Disable](#)
5. [User Guide](#)
6. [Compliance](#)

Requirements

The eLML OpenOffice plugin has been successfully tested on the following platforms:

- Windows XP Professional
- Mac OS X
- Fedora Core 4
- Gentoo
- Suse Linux 9.3
- Kubuntu 6.10

For the plugin to run on your machine, you need a working installation of OpenOffice or one of the derivatives listed below.

Windows / Linux: install OpenOffice.org 2.0.4, which you can get [here](#) in your favourite language

Mac: install NeoOffice 2.0, which is available [here](#).

You need the plugin which can be downloaded from the [eLML](#) website. The editor is only available in German right now but anyone familiar with eLML should be able to use it.

Installation

The eLML OpenOffice Plugin comes as a zip file containing four files.

- **elml_package_1b01.zip** (This is the actual OpenOffice.org Plugin)
- **elml.xsl** (This is the XSL Filter)
- **attributes.xsl** (This is also used for the XSL Filter)
- **help.pdf** (This file)

To install the plugin you have to follow the instructions below:

- 1.) Unzip **elml_ooffice_plugin_1b01.zip** to a folder of your choice
- 2.) Start OpenOffice.org Writer
- 3.) Open the *Package Manager* dialog from the menu (Tools¹ > Package Manager)
- 4.) Add the unzipped **elml_package_1b01.zip** to *My Packages*
- 5.) Close the *Package Manager* dialog
- 6.) Open the *XML Filter Settings* dialog from the menu (Tools¹ > XML Filter Settings)
- 7.) Click *New* to add a new filter and enter the settings below (see Figure 1)

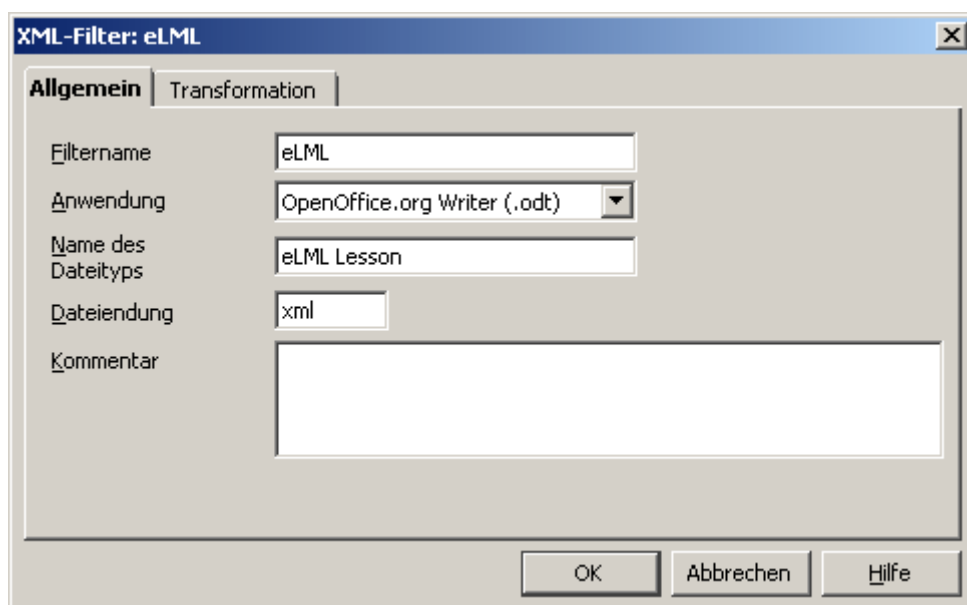

Figure 1: XML Filter Dialog (German OpenOffice.org)

- 8.) Click on the *Transformation* tab and browse for the unzipped **elml.xsl** as your *XSLT for export*
- 9.) Close the *XML Filter Setting* dialog by clicking OK
- 10.) Quit OpenOffice.org Writer. Be sure to also close any QuickStart icons in the taskbar
- 11.) Now you can run OpenOffice.org Writer and use the eLML OpenOffice plugin as a custom toolbar

Uninstall / Disable

To disable or uninstall the eLML OpenOffice plugin you have to start up the Package Manager (see step 3 in the Installation).

Select the *ElmlEditor.zip* from *My Packages* and click *Disable* to disable ElmlEditor (can be easily activated later on) or *Remove* to uninstall the plugin.

¹ The menu is called *Extra* in the German OpenOffice.org

User Guide

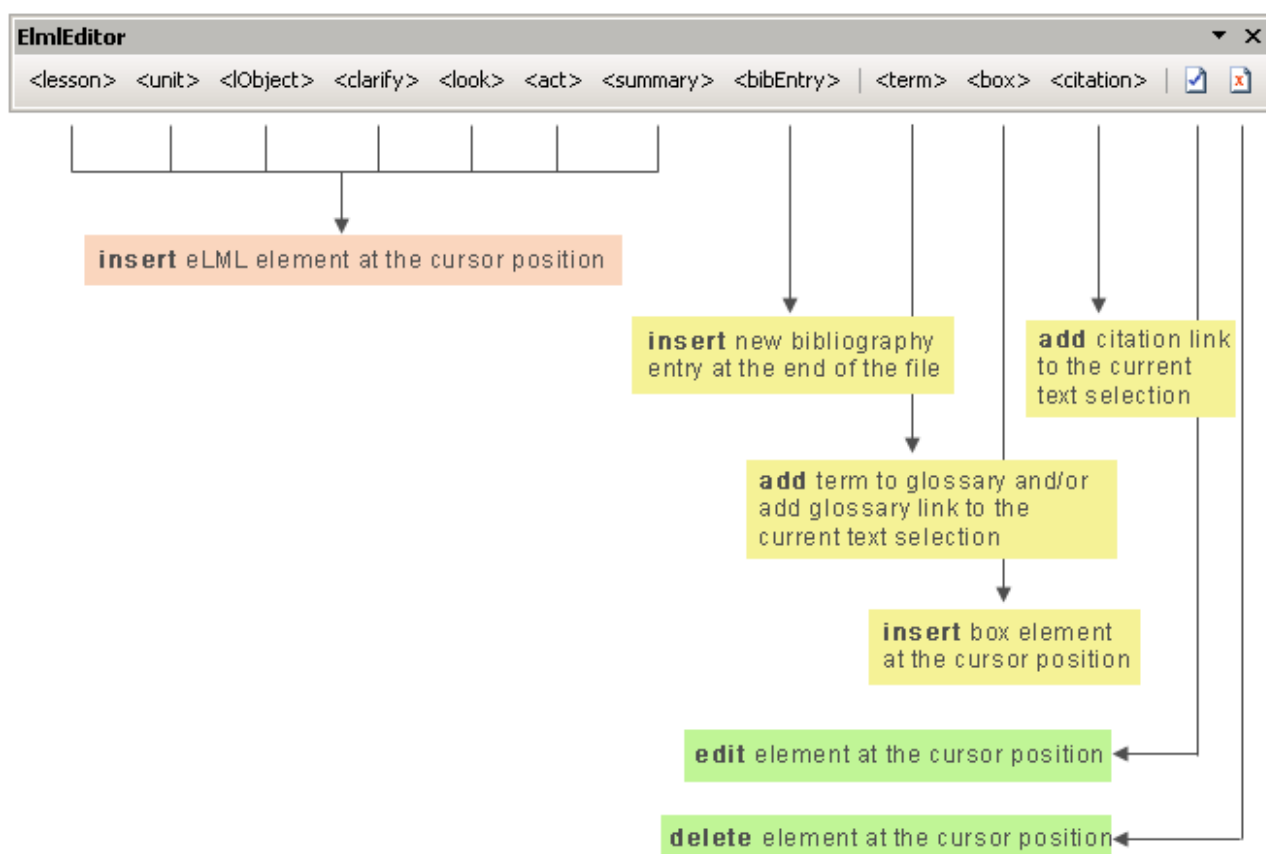

Figure 2: ElmlEditor toolbar

You can create eLML lessons with the structural elements available in the custom toolbar. Remember the eLML Syntax and nesting while creating your lessons to avoid any conflicts later on.

lesson

- unit
 - learningObject
 - clarify
 - look
 - act
- summary
- glossary (automatically added)
- bibliography (automatically added)

The structural elements can be edited or deleted later on by clicking the buttons in the toolbar or by accessing the context menu (see Figure 3). If you select an element to delete, all child elements of that element will be deleted as well. (Example: By deleting a learningObject, all of its clarify, look and act will be deleted)

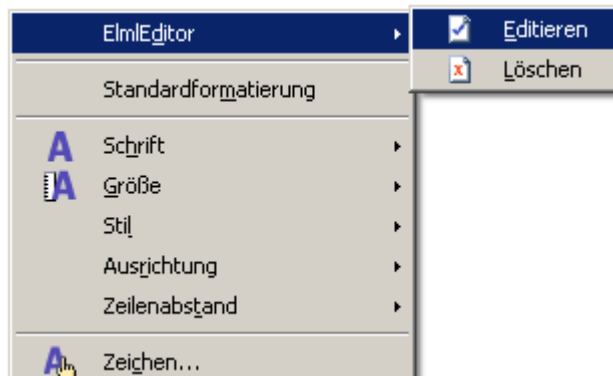

Figure 3: Context menu (German OpenOffice.org)

Content Elements

Additionally it's of course possible to use default OpenOffice.org Writer functionalities inside the eLML structural elements:

- make text bold / italic / underlined / superscript / subscript

Figure 4: Styles

- insert tables
- insert flash (Insert > Object > PlugIn)
- insert images (note: when choosing an image, you have to enable the checkbox at the bottom to link the image instead of importing it (see Figure 5))

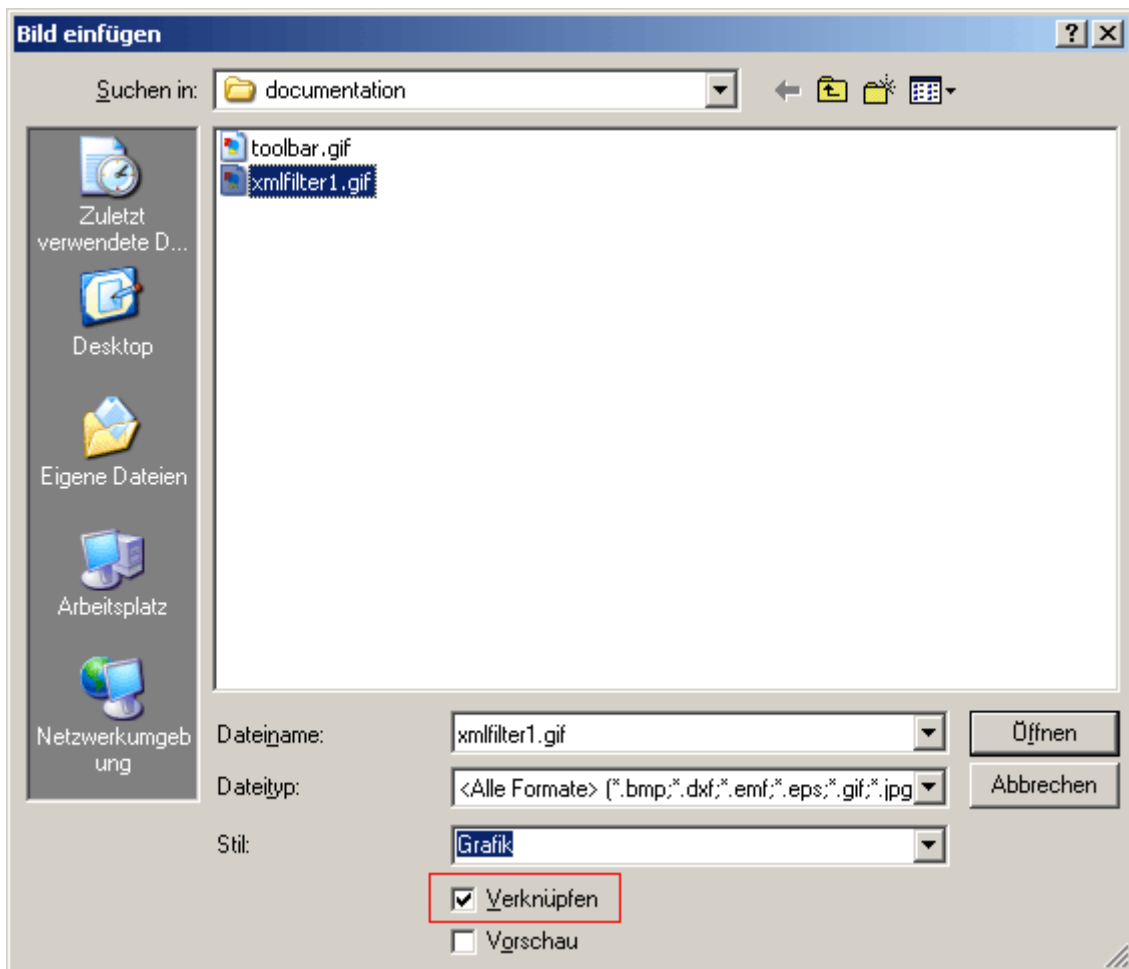

Figure 5: Inserting an Image (German OpenOffice.org)

Export to eLML XML

You can save your lesson to eLML XML by exporting it using the XSL Filter:

1. Open the Export Dialog from the menu (File > Export)
2. Choose *eLML Lesson (.xml)* as your file format
3. Enter a filename and confirm by clicking OK
